The Prez Sez......
by Nicholas AF6CF

Click Click Click St Nick! We are finally in the last month of the year and there are big changes in the OCARC for 2015! We will have a brand new President, V. President, Membership, Treasurer, Technical and Activities Chairpersons.

What we accomplished in the last twelve months as a Club is outstanding. We had another one of the best Field Day events in the Club’s history, being again among the Top Ten overall. So we can safely say that we put the West Coast back in the map as a serious contender, at least for the time being. There is no doubt in my mind that we will hold our standing in the years to come. We had during the year a great many speakers and a fantastic auction. But also, this is the month to celebrate and party. With over a thousand dollars in door prizes, our Club this year went almost “into the red” for the overall expenses for the dinner event, as we decided to give away almost 40 prizes, including the main $500 gift certificate. The party was a GREAT event and those who helped make it happen did an excellent job. Congratulations to Tom W6ETC for winning a well deserved Good of the Club Award and to Tim N6GP for winning the Gift Certificate. Many thanks to Paul W6GMU who led the group of “prize buyers” and to Secretary and President elect Tim N6TMT and his wife who did an absolutely perfect job with the organizing and the women’s gifts. Many thanks too to those companies and individuals who donated prizes to make sure that almost everyone left the event happy. Treasurer Ken W6HHC was not too happy to see the Club not turning a profit for the year, but the President and the Board reminded him that the Club is a “Non-Profit” Organization. Again, the general feeling (even Ken’s) was that once more “A good time was had by all”.

I would like to take this opportunity to thank all the Club members and Officers for their support during these years as your Club President. It’s been my pleasure and an honor to help the Club. So HAPPY HOLIDAYS and a prosperous 2015 to everybody. 73 DE AF6CF

Next Meeting
The next General Meeting of the OCARC will be held on Friday, January 16th, 2015. Don Hill KE6BXT and Joe Ayers AE6XE will present a talk on:

"Broadband-Hamnet…"

The Orange County Mesh continues to grow and they welcome the opportunity to answer questions about Mesh networking. Find out if that old WIFI router you have laying around can be re-purposed for Hamnet. This is cutting edge amateur radio. Don’t miss this meeting!!

like to have your badge mailed to
you.
OCARC has planned an excursion to tour the Battleship Iowa

Saturday, January 10, 2015

And thanks to the Battleship Iowa Amateur Radio Association, our club will get a tour of the radio room and a chance to operate HF from the ship.

"The famed battleship, USS IOWA, was commissioned on Feb. 22, 1943, and served our country for almost 50 years. She was designated as the "World's Greatest Naval Ship" because of her big guns, heavy armor, fast speed, longevity and modernization flexibility, which allowed this battleship to keep pace with technology.

Also known as the Battleship of Presidents, USS IOWA was outfitted in WWII to be the flagship that carried President Franklin Roosevelt across the Atlantic in 1943 for meetings with British Prime Minister Winston Churchill and Soviet Premier Joseph Stalin."

www.pacificbattlehip.com

Cost will range from $12.50 to $16.00 / person

If you are interested in joining us for a fantastic day, direct questions and RSVP to Doug Britton W6FKX at w6fkx@w6ze.org

Baker-2-Vegas Race is Coming

City of Orange RACES is looking for a few more good hams to help

The Baker-2-Vegas Race is a 120-mile-long foot-relay-race between as many as 250+ different law enforcement teams that is run through the desert, from Baker to Shoshone to Pahrump and finally on to Los Vegas. The B2V race will be held on the week-end of March 28th and March 29th this year.

The Orange COAR RACES team will be setting up five Communications Centers along the route as well as operating a “Follow Vehicle” in order to support the running team from the Orange Police Department. COAR RACES always has a need for “few more good hams”. If you are interested in helping, contact: Vern KG6OXD at vrdmrs@sbcglobal.net or Will KJ6IA at willstoddard@pacbell.net

The first COAR RACES planning meeting is set for 7 PM on Tuesday, January 06, in the EOC Room at the Orange Police Station located at 1107 North Batavia Street in the City of Orange.
The OCARC had a good turn out of members and Ladies at the Dinner on December 12.

The Marie Callender's Restaurant provided a very nice quiet venue for the Dinner this year.

Each year the OCARC presents an individual with the “Good of the Club” award. This year Tom Cowart W6ETC (center) was presented the award for his club efforts throughout the year by out-going President Nicholas AF6CF (R) and incoming President Tim N6TMT (L).

The "Good of the Club Award" is presented annually to the OCARC club member who has made the most significant contribution to the club for the year. In 1997, this annual award was then dedicated to the memory of Kei Yamachika - W6NGO, for his year-after-year contributions in support of our club’s activities.

Out-going president Nicholas AF6CF is presented a plaque to thank him for his service as President this year by this year’s VP Tim N6GP.

Out-going President Nicholas AF6CF presents the gavel to 2015 President Tim N6TMT. Always amazed at how happy the out-going president looks during this ceremony??
This year the OCARC provided over $1,000 worth of radio items for door prizes as well as providing gifts of flowers and chocolates to all the Ladies that came.

The first ticket drawn was Robbie KB6CJZ who chose the 800W portable generator as his selection from the group of door prizes.

Tim N6GP (L) won the Grand Prize drawing, a $500 gift certificate to HRO Stores.

Sharon K6IRD has a huge smile as she is surrounded by Poinsettia flowers and boxes of Belgium chocolates provided to ladies. A special thanks to Tim N6TMT and his wife Sheri for organizing the ladies’ gifts.
Ken Taylor W6NIB received his Novice in 1951 as a Boy Scout Explorer. The hams at OCARC helped give him confidence and “elmering” in Ham Radio. In the Vol 1-No 2 issue of RF Newsletter, W6NIB was listed in “Calls Heard” on 75 M. Like many other young hams, ham radio became a motivation and provided experience to help Ken W6NIB go to college at Stanford, obtain good jobs, and form his own company.

Past-Member Ken Taylor W6NIB
gives Thanks and Donation to OCARC

November 5, 2014

Orange County Amateur Radio Club
P. O. Box 3454
Tustin, CA 92781

Dear Club Members,

I would like to make a donation of $400 to financially support the activities of O.C.A.R.C. My check in this amount is enclosed.

I was a member of O.C.A.R.C. long ago, circa 1952-1954. My callsign during that time frame, W6NIB, was provided in the November 27, 1953 edition of RF (75 meters “Calls Heard”).

I still very much appreciate the technical and friendship support provided by O.C.A.R.C. members. Personal respect and encouragement for this young lad was provided by many persons including W6DEY, W6HLL, W6JAN, W6LJH, W6UFP, W6BQP, and W6VAD.

This letter/donation is really about O.C.A.R.C. and not me. But I thought a few facts might be appropriate and of some interest: I was car-driven to the FCC Office/Los Angeles to take my Novice Class test on its first available day, July 2, 1951. My preparation while in Santa Ana’s Boy Scout Explorer Post 43 enabled me to receive my first ticket and get on the air July 27, 1951. Thereafter, attending Stanford University, I became president of the Stanford Radio Club, W6YX, in 1957 before also obtaining an MBA there in 1961. For years thereafter I was employed by the Long Range Planning Service of Stanford Research Institute (now SRI International). After undertaking numerous project leader responsibilities there and elsewhere, I formed my own consultant organization in 1975. In 1995, my firm conducted a unique “due diligence study” for a South Korean company contemplating entrance into the cell phone industry. It is now the largest producer of cell phones. I plan to retire next year sometime after completing a comprehensive unique corporate planning study of U.S. residential digital communications, telecommunications, and media businesses through the year 2024.

In sum, I credit ham radio and specifically the O.C.A.R.C. for enabling a valuable plank in my vocation/career path. And I thank you all for keeping the O.C.A.R.C. drums rolling!

Sincerely, 72/3,

Kenneth W. “Ken” Taylor, W6NIB (ex: WN6NIB, KV67, W7NIB, K7NIB)

Heathkit of the Month #62:
by Bob Eckweiler, AF6C

AMATEUR RADIO - SWL
Heathkit GR-78
General Coverage Portable Receiver

Introduction:
Over the years Heathkit has manufactured a variety of general coverage HF receivers. A few of these have been portable units that are of solid-state construction and can run on battery power as well as off the AC mains.

In Heathkit of the Month #34 I covered the popular Heathkit GC-1(A) “Mohican” receiver. It sold from about 1960 until 1968 with an update in 1962 to alleviate some problems with the initial version. It covers from the AM broadcast band up to 32 mc. in five bands and runs on eight ‘C’ batteries or from an optional AC power supply. In 1967 the GC-1A sold for $89.95, and the optional XP-2 AC power supply for $9.95.

In 1969, too late for the main catalog, Heathkit introduced the GR-78 as a replacement for the “Mohican”. In the 1972 catalog the GR-78 was selling for $129.95. It covers 190 to 410 kc. and from the start of AM broadcast band up to 30 mc. in six bands. The receiver is powered by a built-in 9.6-volt 500 mAh nickel-cadmium rechargeable battery that charges automatically when connected to either the AC mains or an external 12 volt source. The GR-78 remained in production until late 1976; selling for $159.95 in the Winter* 1976 catalog and for $169.95 in the Christmas 1976 catalog. It no longer appeared in the Spring 1977 catalog.

The Heathkit GR-78:
The GR-78 communications receiver, shown in Figure 1, comes in a reasonably small package for its day. It weighs 10 lbs. and measures just 6-1/4” high x 11-1/2” wide x 9” deep. A 6” slide-rule dial, covering the main tuning for the six bands, takes up much of the top half of the front panel with a cylindrical band-spread dial to the left and a vertically mounted S-meter to the right. Two large tuning knobs, two smaller knobs (one dual concentric) and six rocker switches make up the lower half of the front panel. The controls are listed in Table I.

The rear panel (Figure 2) is simple with only five connectors. From the rear, left to right, there is a two-screw terminal strip just left of center near the top designated MUTE; a two (or three) pin 120 VAC connector, then a 12 VDC female two-terminal Cinch-Jones type connector near the bottom; another two-screw EXTERNAL ANTENNA terminal strip near vertical center right and a 1/4” phone jack that is designated PHONES. More on some of these connectors later. On the top left rear of the radio is a multi-section telescoping antenna that can be pulled out for local reception.

There are a few things you should be aware of concerning the rear connectors. The MUTE terminals need to be connected together for the receiver to work. There is normally a jumper

* I often find the term ‘winter catalog’ confusing since winter spans two years. The winter catalog is early in the year. Heathkit also often put out a Christmas catalog near the end of the year.
wire between these two connectors. A word of caution - this jumper contain the full battery voltage on it. Should the receiver touch up against some metal also touching the chassis the battery will be shorted. Since the GR-78 receivers have been around long enough to warrant a battery change, and the newer NiCAD and NiMH batteries can contain quite a wallop, this could be a fire hazard. A fuse, placed in the battery line might make a good modification.

Early Heathkit GR-78s came with a two-prong AC connector and a two-wire power cord. Later, a three-prong connector was used along with a three wire AC cable. Heathkit had a Bulletin (GR-78-5, dated April 16, 1975) for this modification as it related to hum in the GR-78. It involved other component changes as well. The bulletins are available online (See Links).

The female DC 12V connector is rated for 12 - 15 VDC and mates with a two pin (round) Cinch-Jones male connector. The socket on the rear of the GR-78 is setup to accept locking arms available on this connector,. One word of caution is that if the other end is connected to a car battery or such and the plug is not connected to the radio, live 12V can appear on one of the male pins. Be sure to fuse any DC cable you make up to the 12 VDC connector for this radio. My notes show this connector to be a Cinch-Jones 302H-CCTL available from Mouser. Please confirm before ordering one. Should you wire the polarity wrong on the DC cable, the input is diode protected.

The GR-78 is a reasonably sensitive receiver. It uses 15 transistors including 5 MOSFETs. It is single conversion on bands ‘A’ through ‘E’ with
an IF of 455 kc., and dual conversion on band “F” with a first IF of 4.034 mc. It uses four 455 kc. ceramic filters for IF selectivity and no IF transformers making IF alignment simple. The MOSFETS are used in the RF amplifier, mixer, local oscillator, IF amplifier - second mixer and product detector. All the bipolar transistors are silicon types except for the two complementary audio output transistors (2N2430 NPN and 2N2431 PNP).

**Band Coverage:**
The main tuning covers six bands. The ‘A’ band covers 190 kc. to 410 kc. A gap from 410 kc to 510 kc. exists between bands ‘A’ and ‘B’ to provide a buffer for the 455 kc IF frequency. The actual band ranges and the printed nomenclature are shown in table II.

Two separate band-spread dial labels are supplied for the band-spread drum. One if your
interest lies in shortwave listening and one if you are using the radio for amateur operation. The radio is assembled using one or the other. These are also shown in Table II.

**The NiCad Battery:**
The battery supplied with the radio is manufactured by General Electric (Part #42B905JD14-G2), and is no longer available. It is 9.6 volts (eight cells) and rated at 500 mAh. It is cylindrical in shape and is 3-9/16” long by 1-7/16” in diameter. Three wires leave the battery, a black common wire, a red 9.6V wire and a white 4.8V wire connected between the fourth and fifth cell (center tap). The Heathkit part number for this battery is 418-23 (See figure 3).

The battery is required to operate the radio. External power from either the AC-line or an external 12 to 15 volt DC power source only trickle charges the radio’s battery. The radio requires 40 mA from the battery with the radio on and the volume down to zero. At 50 mW of audio the drain is 65 mA; it is significantly higher at full volume of 300 mW. Meanwhile the trickle current charging the battery is only 22 mA when plugged into the AC-line, or 15, 25, or 35 mA when plugged into a DC source of 12, 13.5, or 15 VDC respectively. Thus the battery will discharge with the radio on even when plugged into external power. Operating time with a fully charged battery is specified as 8 hours at normal volume level without any external power. The Heathkit GR-78 specifications state “A full battery charge will be maintained if the receiver is connected to an external power source and used an average of 8 hours daily at normal listening level.” In other words the radio can be operated for 8 hours with external power and charged the remaining 16 hours to bring the battery back up to its fully charged state.

When the radio first came into my possession the battery was dead. It was removed and charged using at a constant voltage of 1.25 volts per cell with the current limited to 25 mA. To my total surprise the battery charged up and
seemed to hold its charge, so it was optimistically put back in the radio. The radio played for a few days, recharging when plugged into an AC outlet. Then suddenly the battery showed all the signs of failing. When the radio was opened up the battery had swollen, pushing a the battery case bottom open exposing one cell.

No physically similar replacement battery could be found so two battery sets were made, each containing four AA sized NiMH batteries. They were wired in series, with a third wire attached to the center-tap. The two packs were taped together and mounted in the same place as the original cylindrical battery using some velcro tape and a heavy tie-wrap through the holes that originally held the battery clamps. The new battery has significantly more mAH than the original battery, allowing longer playing time but also longer charging time.

**GR-78 Circuit Description:**
The GR-78 circuitry is mostly that of a typical receiver circuit. The schematic is too large to include in this article; It can be found online (See Links). Instead, the block diagram is included as figure 4.

**GR-78 RF and Mixer Stages:**
The RF section is constructed on four separate circuit boards, each with one, two or three band-switch wafers mounted to the board. The four circuit boards plug into a mother-board and are stacked so that a single band-switch shaft passes through all their wafers. The four boards are the Antenna Switch Board, the RF Switch Board, the Mixer Switch Board and the Oscillator Switch Board.

The **Antenna Switch Board**, has two switch wafers. One wafer connects the lead from either the attached whip antenna or external antenna connector to a tap on one of the six antenna band coils. The switch also grounds the tap to all the antenna coils not in use. The second wafer section connects the output of the selected band coil to the next stage. Each coil can be tuned by a slug and each coil is shunted by a trimmer capacitor. These coils and trimmers are mounted on the small circuit board. The selected coil is also shunted by the first section of the main tuning capacitor, tuning the selected circuit as the main tuning dial is moved.

The **RF Switch Board** contains the RF amplifier that uses an RCA 40673 dual-gate MOSFET. The signal from the antenna switch board is coupled to one gate of the FET. An external AVC voltage is fed to the second gate to reduce the gain on strong signals. The FET drain circuit has tuned circuits that use two switch wafers and operate the same as the previous board. A second section of the external main tuning capacitor shunts and tunes the selected coil.

The **Mixer Switch Board** uses an RCA 40604 dual-gate MOSFET to mix the signal from the RF amplifier and the local oscillator to produce the signal at the IF frequency. The signal from the RF amplifier switch board is fed to one gate of the transistor. The second gate is fed by the local oscillator signal. The output signal is the difference between the two frequencies, which is 455 KHz on bands “A” through “E” and 4,034 KHz on band “F”. The output is tuned by one of two coils; bands “A” through “E” use a 455 KHz coil, and band “F” uses a 4,034 KHz coil. This switching is done by the single switch wafer on this board. However this wafer has a rear section that switches on power to the conversion oscillator when receiving band “F”. A trap is connected to the output of the mixer on bands “A” through “E” to remove a spurious signal near 5,5 MHz. Output from the mixer switch board is fed to the first IF amplifier.

The **Oscillator Switch Board** provides the heterodyning frequency to the previously mentioned mixer board. This oscillator tunes 455 KHz ABOVE the tuned frequency on bands “A” through “D”, 455 KHz BELOW the tuned frequency on band “E” and 4,034 KHz ABOVE the tuned frequency on band “F”. The oscillator circuit is of the Hartley type and uses an RCA 40468 single-gate MOSFET. Six oscillator coils mount on the board, each with a tap partway
down the coil for feedback; the low end of all the coils are connected in common. Three switch decks mount on the board; one selects the tap on the band oscillator coil being used, the second selects the top of that same coil while shorting all the unused coils. The third switch deck switches in a different capacitor for each band. This capacitor is placed in series with the third section of the main tuning capacitor effectively setting its range. A single band-spread tuning capacitor is in parallel with this section of the main tuning capacitor providing the band-spread function.

GR-78 IF Stages:
A large Receiver Circuit Board contains the rest of the GR-78 circuitry except for the components that mount directly to the chassis. There are three stages of IF. The initial stage uses a 40673 dual-gate MOSFET. On bands “A” through “E” it operates as a 455 KHz amplifier; on band “F” it operates as a second mixer providing double conversion. The signal from the RF mixer stage is fed to one gate of the MOSFET. On bands “A” through “E” the second gate is DC biased for proper operation. On band “F” a 3,579 KHz is superimposed on this gate and mixes with the 4,034 KHz IF frequency to produce 455 KHz as well as other mixer components. However only the 455 KHz component makes it through the four ceramic 455 KHz filters that are connected in series.

The output from the filters is amplified in the ‘first’ IF stage which uses a silicon bipolar 2N3694 transistor. Bias for this stage comes from the AVC amplifier, reducing the gain on strong signals. As the gain is reduced, the emitter voltage becomes less positive. This change in voltage is measured by the signal strength meter. A potentiometer sets the zero point meter voltage.

The ‘second’ IF stage also uses a 2N3694 transistor. This stage operates at a fixed gain. The output of this stage is fed to an AM detector, a product detector and the AVC circuits.

The only alignment needed for the IF section are the two coils on the mixer switch board (one at 455 KHz for bands “A” through “E” and one at 4,034 KHz for band “F”).

The 3,579 KHz conversion oscillator for the second mixer is crystal controlled using an inexpensive TV color-burst crystal and a 2N3694 transistor. Power for this oscillator is only applied when the receiver is on band “F”.

AVC Circuits:
To prevent stages from being overdriven when receiving strong signals The RF amplifier and the ‘first’ IF stage reduce their gain in response to an AVC (Automatic Volume Control) voltage. Actually two separate AVC voltages are created since the two controlled stages use different types of semiconductor devices.

AVC voltage for the RF stage is developed by a pair of diodes that rectify and double the signal voltage developed at the collector of the last IF stage. This voltage is biased for correct no-signal gain and fed to one gate of the RF amplifier MOSFET. This negative-going voltage reduces the gain of the RF stage, depending on the level of the received signal. An RC circuit on the mother board sets the AVC timing.

AVC for the ‘first’ IF stage is developed by the AVC amplifier. The signal from the final IF stage is coupled to the base of a 2N3694 transistor. This stage is biased near cutoff so that the signal is rectified. A DC voltage is developed across the collector resistor and filtered. This positive voltage is used to provide bias to the IF stage. As the level of the received signal increases the bias voltage to the first IF stage is reduced reducing the gain.

A front panel switch disconnects the output of the ‘second’ IF from the AVC circuits when MVC (Manual Volume Control) is selected.

Detector Stages and BFO:
The signal from the ‘second’ IF amplifier is also sent to the two detectors. AM is detected by a
1N191 small signal germanium diode and a capacitor to remove the rectified IF component.

CW and SSB are detected by a product detector that uses an RCA 40673 dual-gate MOSFET. The signal to be detected is coupled via a small capacitor to one of the gates. The other gate receives a signal from the BFO (Beat Frequency Oscillator). The output of the product detector is filtered to remove all but the audio components.

A front panel AM - CW/SSB switch selects which detector output is fed to the next stage. When CW/SSB is selected power is also applied to the BFO.

The BFO is a Colpitts oscillator operates on a frequency of 455 KHz. Other than the internal coil slug it has no external frequency adjustment. The IF is wide enough that the user needs only to tune to the desired sideband or CW pitch. The Colpitts oscillator provides a quite stable BFO signal right from when it is activated by the AM - CW/SSB switch.

Automatic Noise Level (ANL) Stage:
Audio is routed from the selected detector through the ANL circuit. The ANL circuit consists of a diode that is forward biased. The audio is then passed through the diode and any large pulses cutoff the diode removing them from the audio. When the ANL switch is in the off position the audio is routed around the diode through a 0.22 µF coupling capacitor.

Audio Frequency Amplifier Stages:
Audio is then routed through the AF GAIN control and capacitively coupled to the audio preamplifier. The two stages of pre-amplification consist of an NPN 2N3392 transistor and a PNP X29A829 transistor, both silicon bipolar types. They are directly coupled together and directly couple to the audio output stage that consists of 2N2430 (NPN) and 2N2431 (PNP) complementary pair. This circuit, with its DC coupling, and no need for an output transformer to drive a speaker, provides low distortion audio to the speaker. Audio is also fed back to the emitter of the first audio stage reducing gain and improving linearity. The speaker output is coupled through a 100 µF electrolytic capacitor to the built-in 16 ohm speaker. An ear phone jack is also provided. Bias for the base of the first audio stage is obtained by a voltage divider from the 9.6 volt line. It first passes through the RCV - STBY switch which is in series with the MUTE terminals on the rear of the receiver. (The MUTE terminals must be connected together for the radio to operate). Should the terminals be open or the RCV - STBY switch be in standby no voltage reaches the voltage divider and the stage remains biased off, muting the receiver.

Battery Charging Circuit:
Figure 5 is a representative schematic of the GR-78 charging circuit. When AC is supplied to the radio it is stepped down by a small transformer to around 6 volts. One lead of the secondary winding is connected to the center-tap of the battery. The other lead goes to two diodes so that on a positive half-cycle of the AC one-half of the batteries are being charged and on the negative-half cycle the other half of the batteries are being charged. The transformer has a dual primary and may be wired for 120 or 240 VAC 50/60 cycle operation.

When 12 - 15V DC is applied to the radio, the negative terminal is connected directly to the battery negative lead and the positive lead is connected via a diode for polarity protection, a
#53 pilot lamp; as a compensating resistor and a 22Ω current limiting resistor to the battery’s positive terminal. The lamp is internal and barely lights, but tends to increase in resistance as the current through it increases.

One unusual aspect of the 12 volt charging system is that the radio power switch is between the negative battery terminal and common. So, if the 12 volt charging source and the receiver share the same common, the power switch is shorted out and the radio is on regardless of the position of the OFF-ON switch!

Two tiny “grain-of-wheat” lamps light the tuning dials, but only when the momentary LIGHT rocker switch is held on; this is obviously done to save battery life.

**Crystal Calibrator:**

When the front panel CALibrate switch is activated power is fed to a 500 KHz crystal oscillator. Output of the oscillator is lightly coupled to the input of the RF oscillator stage, producing marker signals every half megacycle to provide markers for the tuning dial.

**My GR-78 Experiences:**

The GR-78 is rather new in my Heathkit stable, at least as a functioning unit. As mentioned earlier, the battery seemed to charge up but quickly failed. While I looked for an exact replacement and then a substitution, it sat on the shelf looking nice but not useable. Now it is in need of a good alignment, and the “F” band oscillator is intermittent, so it will need to be brought up to snuff after the workbench clears of some non-Heathkit items.

Heathkit released ten technical notes on the GR-78 between early 1970 and early 1984 (these are available online - see links). Some of these have already been done; the receiver came with a Heathkit factory repair sticker inside. Three of these modifications specifically address “F” band issues. The most noticeable factory modification I’ve noticed is the change to a three wire power cord. Both the two and three wire power cords are hard to find today. The 2-wire cord is the same cord as supplied with the SB-301 and SB-401; it is Heathkit part #89-3; the mating chassis connector is part #432-4. The 3-wire power cord used on the later GR-78 is the same cord as supplied with the SB-303 part #89-30; the mating chassis connector is part #432-76. A few other factory mods have been made, but many I have not checked out yet.

In order to save space and money, Heathkit compromised the band-spread function on this radio. The single section band-spread variable capacitor only tunes the oscillator section so sensitivity drops as you move from the set position since the RF and mixer stages do not track.

Ken - W6HHC passed this radio on to me. He got it from OCARC club member Joe Quick - KE6ZMG at the “Watson Radio Club” breakfast, who got it from a neighbor. Ken knew my interest in Heathkits and thought this radio would make a good subject for a Heathkit of the Month article.

I’d like to thank Joe and also again Gene - AF9O who passed along the 1969 catalog that covers all the Heathkit station equipment I bought back when I was just getting on the air after college.
The OCARC General Meeting was held at the Red Cross Complex on November 21st 2014. The meeting was called to order at 7:03 pm. Tom Woodard, KI6GOA with the Red Cross briefed the membership that he is taking on a new job with Orange County Transportation Authority and therefore will no longer be our liaison with the Red Cross. He will make sure that we continue to have good contacts with Red Cross as he will continue to be a volunteer there even after he begins his new employment with OCTA. Members are reminded of the club Christmas dinner on December 12th at the Marie Callender’s restaurant in Anaheim Hills.

Our main speaker for the evening was Dennis Kidder – W6DQ. Dennis was first licensed in 1969 as a novice. He spent his 30 year career at Raytheon Hughes where he worked on a variety of projects including radar systems for the Hong Kong Airport. Dennis is an antique radio collector and speaker at many of the amateur radio clubs in California. Dennis has also just completed authorship of a book – Arduino Projects for Amateur Radio. His topic for us is titled “History of the Development of Modern Communications Receiver – Part II – Post WW2 to Present”.

Dennis provided his scope of the receiver world moving forward starting with the World War 2 period. The initial changes were not in the design area but in the mass ramp up of manufacturing that the war effort provided. People that never before had been exposed to the technology were brought into the radio world as soldiers, sailors and air men.

After the war, various research efforts started to bring about new technology. Of particular importance was the crossover of telephone technology into the realm of radio communications.

Some of the final subjects that he touched on were the widening usage of Digital Signal Processing (DSP) and the prospects that Direct Sampling Receivers provide.

All in all it was an enjoyable and informative presentation. Dennis offered to provide us with a contact who is very well versed in the SDR technology as a possible follow up presentation for the near future.
After a short break the meeting reconvened to cover club business. A quorum of OCARC Board members was present, with only Doug – W6FKX absent.

The first and most anticipated item of interest was 2015 Board Officer Elections. After various discussions and gentle arm-twisting a full slate of officers for 2015 were nominated.

A motion was made and seconded to vote on the whole slate at once. A voice vote was then taken with the motion approved to elect the following new officers to serve during the 2015 term.

One other item was presented to the membership which was a letter [see pg 6] from former member Ken Taylor W6NIB. Ken had been an OCARC member as a youth back in the 1950’s and sent the club a $400 donation as a measure of thanks for those in the club who helped him get established in the ham radio hobby and also afterwards ham radio then helped launch his vocation.

Submitted by Tim N6TMT, secretary OCARC

**Model TSA4G1**

**USB Mini Spectrum Analyzer**

**Up to 4 GHz - Only $529**

The model TSA4G1 is a very low cost USB mini spectrum analyzer manufactured by Triarchy Technology. It can do most of all basic test items that a general spectrum analyzer can do. TSA4G1 is a very tiny instrument, but it can cover very wide measurement range. It covers frequencies up to 4 GHz, handles powers up to 1W, noise level low as -110 dBm. Test data will be displayed with calibrated level, linearity and frequency.

**Figure 1 – Hardware module for the Spectrum Analyzer has only a SMA jack for RF and a USB plug**

The Model TSA4G1 has an amazing price of only $529. For hams, this is very affordable compared to prices of even used industrial Spectrum Analyzers from HP or Agilent. Other (more expensive) models are available that work up to 6 GHz and 8 GHz.

**Figure 2 – Software does all the work using your Notebook or even a tablet computer connected by USB. (Shown here measuring Channel Power)**

- Digitally synthesized RF system
- Frequency range up to 4.15 GHz
- Input Levels: -110 dBm to +30 dBm
- Resolution Bandwidths – 50 KHz, 100 KHz, 200 KHz, and 500 KHz
- Power Source is 5 V from USB port

NOW OFFERING
AMATEUR RADIO VE TESTING SESSIONS
Contact V.E. George T. Jacob Jr. N6VNI
Phone Numbers: Home Phone: 562/691-7898  Cell Phone: 562/544-7373
Email: jac2247@gmail.com  Or N6VNI@arrl.net
Sponsoring Club: N6ME Western Amateur Radio Association, Fullerton, Ca. "WARA"
Test site location:
La Habra Community Center.
101 W. La Habra Blvd., La Habra, CA 90631
Date and Times - Third Thursday of every month, @6 P.M. unless otherwise noted. Pre-Registration is requested and preferred. Walk-ins are welcome.

2015 TESTING SESSIONS
Thursday, January 15th, 2015 6 p.m.  Thursday, Sept 17th, 2015 6 p.m.
Thursday, February 19th, 2015 6 p.m.  Thursday, October 15th, 2015 6 p.m.
Thursday, March 19th, 2015 6 p.m.  Thursday, Nov 19th, 2015 6 p.m.
Thursday, April 16th, 2015 6 p.m.  NOTE: Location change – this date only
(Home of George N6VNI, 1901 W. El Portal Drive, La Habra, CA 90631)
Thursday, May 21st, 2015 6 p.m.  NOTE: Location change – this date only
(Home of George N6VNI, 1901 W. El Portal Drive, La Habra, CA 90631)
Thursday, June 18th, 2015 6 p.m.
Thursday, July 16th, 2015 6 p.m.
Thursday, August 20th, 2015 6 p.m.

On Exam Day Bring the Following Items
- A legal photo ID (driver’s license, passport) or Two forms of non-photo ID; e.g., birth certificate, social security card, library card, utility bill or other business correspondence with name of the examinee as it appears on the Form 605 and current mailing address.
- Your Social Security Number (SSN) or FCC-issued Federal Registration Number (FRN).
- If applicable, the original and a photocopy of your current Amateur Radio license and any Certificates of Successful Completion of Examination (CSCE) you may have from previous exam session. (Photocopies will not be returned.)
- Two number two pencils with erasers, and a pen.
- Test Fee: $15.00 (cash or check).

If you fail an element and wish to retake it, we are required to charge an additional test fee. If you pass an element, we typically offer and encourage you to take the next element. We do not charge an additional test fee for this and it gives you the opportunity to see what the next exam element is like!
Digital Amateur TeleVision
Exciter/Transmitter

now available from

DATV-Express

- A more affordable DATV exciter can now be ordered
- Fully assembled and tested PCBA
- DVB-S protocol for DATV (using QPSK modulation)
- Can operate all ham bands from 70 MHz-to-2450 MHz
- RF output level up to 10 dBm (min) all bands (DVB-S)
- Software Defined Radio (SDR) architecture allows many variations of IQ modulations
- “Software-Defined” allows new features to be added over the next few years, without changing the hardware board
- As extra bonus, the team has been able to get the board to transmit DVB-T 2K mode, however we cannot guarantee the performance of that protocol. Caveat Emptor!
- Requires PC or ODROID running Ubuntu linux (see User Guide)
- Price is US$300 + shipping – order using PayPal
