The Prez Sez.....
by Dan KI6X

I want to thank all those that stepped up this year to make the year so great. We had really great speakers/presenters at our meetings, helpers and other participants. The OCARC Officers worked hard to keep things humming despite the “wrenches” thrown our way. It was easy working with the team.

Remember that the November meeting is our election for Officers for next year that then start their term in January. You hopefully got an idea of what the Officers do from the monthly “Officer of the Month” articles and that you will consider running for an office. We encourage nominations at the meeting. The slate by the Nomination Committee is to get a start on a slate and we always want more volunteers to get nominated. To keep a smooth transition, this year’s Board still plans out the early next year activities. We will have our Auction at the January meeting (moved from October). Again, see announcement elsewhere. We will be participating in Winter Field Day the last weekend of January. So, as you can see this year’s Board can’t just plan through the end of this year and we hope next year’s Board has enough for a smooth start.

Dan, KI6X, President

NEXT GENERAL MEETING
Friday, November 15, 2019
@ Red Cross, Santa Ana
7:00 PM

PRESENTER
Kevin - KI6DHQ
Owner of Bioenno

* $3 or less + mailing. See form.
OCARC ANNUAL AUCTION

REVISED

OCT. 2019 AUCTION CHANGED TO JAN. 2020

January 17th, 2020
7:00PM at the American Red Cross “George M. Chitty’ Bldg.”
600 Parkcenter Drive, Santa Ana, CA
Mark your calendars and plan on attending this exciting event!

Image by W6ETC
AUCTION RULES

The OCARC Annual Auction will take place on Friday evening, January 17, 2020, at 7:00 PM at the American Red Cross facility located at 600 N. Parkcenter Drive, Santa Ana. The room will open at 6:00 PM to allow registration, set-up and viewing. All buyers and sellers are welcome. The following rules for the auction will be in effect:

1. Only ham radio or electronic equipment / items will be auctioned (i.e.: no fishing equipment, etc)

2. Buyers and Sellers must register at the door with the OCARC Treasurer. There is NO registration fee.

3. Sellers should number each item in their lot. A tag should indicate the minimum bid they expect.

4. Only 3 items from a Sellers lot will be auctioned during each turn. After auction 3 items, the auctioneer will move on to the next lot. After the first 3 items from every lot have been offered for bidding, the auctioneer will start the second round of auctioning with the next 3 items in Lot #1.

5. Auction bidding will take place as follows: (a) $0.00-to-$5.00 bidding will take place in $0.50 increments. (b) Over-$5.00-to-$50.00 bidding will take place in $1.00 increments. (c) Over-$50.00-to-$100.00 bidding will take place in $5.00 increments. (d) Over-$100.00 bidding will be in $10.00 increments.

6. Rules 4 and 5 may be changed at the auctioneer’s discretion to expedite the auction.

7. Payments for purchased items are due at the end of the auction and shall be by cash or check with the appropriate ID. No two-party checks or credit cards are allowed. Disbursements to the Sellers will be by OCARC check, only. Sellers will be charged 10% of the selling price for items sold by OCARC.

A special table will be set up for donated items. The proceeds of donated items will go to the OCARC.

AUCTION ADDITIONAL INFO

NEW THIS YEAR:

- Create a list of your items and a brief description. This will be used for the Auctioneer and if you get the info in by the December newsletter some of your items might be included in an auction advertisement in the RF. You may send your list (no description needed for this) to the President or Vice-President as listed on page 2. They will get to the newsletter editor.

- Sellers bring an SASE (Self-addressed & stamped envelope) if you prefer we send you your money instead of having to wait in line. Remember buyers go first in line, then sellers.
NOMINATING COMMITTEE REPORT

SLATE OF THOSE RUNNING FOR THE 2020 OCARC BOARD OF DIRECTORS AS BROUGHT FORTH BY THE NOMINATING COMMITTEE:

Others can be nominated to the list at the November meeting. More than one person can run for any position on the board.

PRESIDENT – Dan KI6X
VICE PRESIDENT— Tim N6TMT
SECRETARY — Ken W6HHC
TREASURER — Greg W6ATB
ACTIVITIES — (open)
MEMBERSHIP — Corey KE6YHX
PUBLICITY/PUBLIC RELATIONS — (open)
TECHNICAL— Bob AF6C
DIRECTOR AT LARGE (2) — Tim N6GP & Ron W6WG

This list of suggested names is not final or “all inclusive” and it is subject to change at or before the November 15th Elections.

If you want to run for a position on the OCARC Board of Directors, please contact the Elections Committee Chairman (Tim N6TMT, see pg. 2) or get nominated at the election meeting.
OCARC Holiday Party!!!!
Friday, December 6th

Come and celebrate the Holiday season with OCARC on **Friday, December 6th, 2019** at Mimi’s Cafe in Tustin. **Social hour begins at 5:30 PM.....Dinner at 6:30 PM,**

Easiest way to pay and reserve your spot is to go to our weblink below:

http://www.w6ze.org/XMAS/Christmas-Paypal.html

This will allow you to reserve a place for you and your party. Tickets are $29 per person with a $1 PayPal fee per ticket for a total $30 on online. $29 if paying cash or check.

You may also purchase your tickets at our next General Meeting or e-mail “Treasurer” at W6ATB@w6ze.org to arrange purchasing your holiday party dinner tickets! Remember to bring your spouse and friends too! Amateur entertainment will be provided.

Dinner is priced at $29 per person and it includes the following meal choice:

- 10oz Grilled Steak with mashed potatoes and broccoli
- Grilled Atlantic Salmon with mashed potatoes and broccoli
- French Pot Roast on bed of mashed potatoes
- Slow-Roasted Turkey with gravy, cornbread stuffing, cranberry relish, with mashed potatoes and broccoli

All dinners include a choice of coffee, tea, lemonade or soft drink and come with choice of house salad, Caesar salad or a cup of soup. (Tax and Tip is included)

Also an “Add a Dessert” for $5 for Molten Lava Cake or Crème Caramel (pay at dinner)

You do not need to make your meal selection until the evening of the event but you must reserve your place and let us know in advance by Tuesday night Dec03, since seating is limited.

Check the club website www.w6ze.org for info:

Drawing prizes include: $500 in gift certificates and items. Drawing tickets are available for $1 per ticket.

Grand Prize: $100.00 HRO Gift Certificate

Mark the date on your calendar!

Friday night, December 6th - gather at 5:30pm.

Location:
Mimi’s Cafe
17231 E. 17th St., Tustin, CA 92780
Located East of the 55 Freeway at the 17th St. Tustin exit.
Restaurant is on North side of street next to the freeway.

https://www.google.com/maps/place/17231+17th+St,+Tustin,+CA+92780 location map
(final message from the Pitcairn DXpedition – OCARC member Arnie, N6HC, was a participant)

Nov.1 2019: The VP6R DXpedition is now QRT. The last QSO went into the log at 1800 UTC with a QSO total of approximately 80,000. All the antennas are safely down and packed and the team is breaking for lunch.

On behalf of the team, our off-island support members, and our sponsors; may I say thank you to our DX audience for your interest, support, and of course, the QSOs.

To the kids at the Dorothy Grant Elementary School, thank you for taking part in this great adventure with us through ham radio. You brightened our path.

We had fun with this. We hope you did too.

73 — Ralph – K0IR

Heathkit of the Month #096:  
by Bob Eckweiler, AF6C

ELECTRONIC TEST EQUIPMENT  
Heathkit IO-21 3” Oscilloscope

Introduction:
It was the beginning of something big. It might have started in a garage in Los Altos, CA, but it enthralled me in a ham shack in Santa Ana. That was where I first got to play with an Apple II™ computer. It was in the early second half of the 70’s, and the shack belonged to fellow club member Ken, W6HHC. Disk drives were still up in the $600 price range, so programs were stored on, and loaded from, cassette tapes. This beige computer that looked like a typewriter had captured our imaginations, so we surrounded it after many club nets.

Loading programs from cassette tape was tricky. So Ken brought out his trusty Heathkit IO-21 oscilloscope with its 3” CRT screen and used it to monitor the cassette recorder signal to the computer. If the signal had the right amplitude and showed no signs of waveform clipping the program loaded without problem. In those days I wonder if there weren’t a lot of scopes hooked up to computers using tape cassette recorders? A successful load depended on having the cassette player volume control set just right for the level the program was originally recorded at. With an oscilloscope it was visually easy to do that.

The IO-21 (Figure 1) had some unusual features, but it did a lot of things very well.

The IO-21 3” Oscilloscope History:
The IO-21 first appeared in the Fall Winter 1961 Heathkit catalog with a “New Through Heath Research” logo appearing near the top of the page. It appeared alongside the more advanced year old 3” IO-10 DC oscilloscope in a two-page spread, each scope taking up one full page with lots of descriptive text and a small image of each schematic. The IO-21 scope was very popular and many were sold over a ten plus year production run. It was not directly replaced, but sold alongside the IO-17 for about three years. The IO-17 con-

Here is a link to the index of Heathkit of the Month (HotM) articles:  
http://www.w6ze.org/Heathkit/Heathkit_Index.html
continued to sell for a year after the IO-21 and was the last of the 3-inch CRT oscilloscopes offered by Heathkit. The IO-21 first sold for $49.95; by 1971 the price had increased to $61.95 - almost a 25% increase. The IO-21 scope could be bought as part of Heathkit’s EF-2-3 “How to Understand and Use Your Oscilloscope” course. The 5” IO-12 scope (EF-2-4) and later the 5” IO-18 scope (EF-2-5) were also available with the course.

| Heathkit IO-21 & IO-10 Catalog Prices |
|---|---|---|
| Catalog | IO-21 | IO-10 |
| Fall Winter 1961 | $49.95 | $79.95 |
| Main 1966 | $54.95 | $89.95 |
| Main 1971 | $61.95 | $99.95 |

**The IO-21 3” Specifications:**

While not a top performer compared with other scopes of the time, The IO-21 has a big advantage of size as well as low cost. Measuring 9-1/2” H x 6-1/2” W x 10” D, it takes up less than half the workbench area of a typical 5” scope. Also, its low height means it is more likely to fit under a shelf above the workbench. With a bandwidth of ±2 db from 2 cps to 200 KC it has better response than the OL-1 it replaced. The OL-1 is specified at ±3 db from 2 cps to 200 KC. and ±6 db from 1 cps to 400 KC. ±2 db represents a change in trace height of about ±20% while ±3 db represents a change of about ±29% and ±6 db represents a change of about ±50%.

One improvement over the OL-1 is the CRT used. The OL-1 uses a WWII vintage 3GP1. Sometime in the early 60's Heathkit standardized on a new generation 3” CRT, the 3RP1. For their spectrum analyzers like the SB-620 Heath used the high persistence phosphor version, the 3RP7. The 3RP1 and 3RP7 were upgraded with a flat screen and carried an ‘A’ suffix (3RP1A etc.) that Heathkit used in some of its later products such as the SB-614. The IO-21 was one of Heath’s early adopters of the 3RP1 CRT.

The IO-21 is missing some features you would expect on even the simplest beginner scope. First, it has no intensity control whatsoever to adjust the trace brightness. It also has no FOCUS adjustment on the front panel. The manual specifications says it and the ASTIGMATISM control are “rear controls”, but they are really internal rear controls that require you to remove the cabinet for access. Also there are not any sync. adjustment controls. The sweep multivibrator receives a sync signal directly from the vertical amplifier output. The user just adjusts the sweep frequency until the sync locks in, freezing the display. There is no way to switch sync polarity.

Another missing feature is a front panel TEST voltage output. This output is often just a low-voltage 60-cycle output derived from the filament winding. Even on the simplest of scopes this output is common, and sometimes calibrated to be 1 volt peak-to-peak for calibration purposes. On more expensive scopes it is a calibrated square wave, usually of a higher frequency than 60 cycles.

There is also no attenuator on the vertical input amplifier. The older Heathkit OL-1 scope also lacks a vertical attenuator, though it has front panel intensity and focus controls as well as a sync amplitude control, an ext. sync input and a 60 cy test output.

Surprisingly, the IO-21 scope was used for quite awhile before the missing controls were noticed. Focus, astigmatism and intensity controls, on all but the high end scopes, interact. Fixing the intensity level and hiding the other controls solves that problem.
the scope only goes up to 200 KC there is little dimming at high frequencies. Never, while using the scope, was there a feeling that the trace intensity was inadequate. The synchronization was also never a problem. On the plus side this scope has a simple blanking circuit that turns-off the trace as it sweeps back from right to left. This is missing from many of the older, less expensive, scopes including the OL-1. Figure 2 is a photo of a trace from the earlier Heathkit OL-1 without blanking.

An ASTIGMATISM adjustment is also something not found on many earlier scopes. It requires a capability that is part of the CRT. The war surplus 3GP1 lacks that capability; it is present in the newer 3RP1 series CRTs.

The IO-21 is specified as having identical vertical and horizontal amplifiers, though this is not exactly true. While the differences are minor they are there. That will be discussed later.

Figure 2: Scope trace showing the lack of retrace blanking. Note the almost horizontal retrace line connecting the trace start to the trace end.

Figure 3: A lineup of 14 IO-21 Oscilloscopes undergoing evaluation by a technician at the Heathkit factory. It was customary to have Heath employees build new kits for evaluation. Construction experience data was given to the manual department, and the completed kits were evaluated by technicians for performance. Photo from Gene Fiebich estate via Chuck Penson.
The IO-21 3” Oscilloscope Controls:
Only six controls, arranged in two rows of three, are on the front panel. Also on the front panel is the CRT face, which is in a bezel with graticule and hood, and two sets of 5-way binding posts, one for vertical and one for horizontal input. A neon pilot lamp provides power indication. Table IIA lists the six controls and their markings.

The rear panel has two banana jacks and a slide switch. These allow the user to directly AC couple a signal to the vertical deflection plates. This is handy for monitoring a transmitter’s output at frequencies higher than the built-in vertical amplifier can handle. Rear panel controls and connections are listed in Table 1B and shown by Figure 4. When in EXT. external mode the VERTICAL CENTERING control continues to function. Three paper stickers are included in the kit to mark the rear slide switch and its positions.

Two internal 500 KΩ potentiometers adjust the FOCUS and ASTIGMATISM, and are adjusted for the minimum size round dot. When adjusting these controls - first, use a well insulated screwdriver; there is high voltage in the area of these controls. And second, do not allow the spot to remain in one place on the screen too long so you don’t damage the CRT’s phosphor coating.

The IO-21 Circuit:
The IO-21 ads state the vertical and horizontal amplifiers are “identical”; while in the

---

**Figure 4: Heathkit IO-21 Rear Panel**

---
After looking at the vertical amplifier the differences will be discussed.

**Vertical Amplifier:**
The vertical amplifier uses a pair of 12AU7 dual triodes. Figure 5 is a schematic of the vertical amplifier. The first stage, V3A is an AC coupled cathode follower circuit with the bias resistor bootstrapped by R3. This effectively increases the input impedance above the 2.2 MΩ of R1 because of the large in-phase voltage that appears at the junction of R2 and R3 allowing the input resistance to be on the order of 10 MΩ. The output is AC coupled through the VERTICAL AMPLITUDE control to V3B which is a standard voltage amplifier. Its output is DC coupled to the grid of V4A which drives one of the CRT vertical deflection plates (pin 6). V4A signal is also coupled via the common cathode resistor R10 to V4B. The bias for V4B is statically set to a voltage close to the quiescent grid volt-

TABLE III: Schematic (Figure 5) Component ID and Values for Vertical and Horizontal Amplifiers
age of V4A. Due to the coupling, the output of V4B is equal, but 180° out of phase, with the output of V4A. This signal is sent to the other CRT vertical deflection plate (pin 7). The bias on V4B can be adjusted by the VERTICAL CENTERING control. This makes one section of the output 12AU7 draw more current and the other less current, effectively moving the trace in the vertical direction. The stages after the initial cathode follower are DC coupled.

**Horizontal Amplifier:**

The horizontal amplifier is identical except for the coupling between the cathode follower V2A and the voltage amplifier V2B. While the vertical amp uses a 2 µF capacitor with a 50 KΩ VERTICAL AMPLITUDE control, the horizontal amplifier uses a cheaper 20 µF electrolytic capacitor with a 50 KΩ HORIZONTAL AMPLITUDE control. Why the difference? What it does is lower the low-end 3 db frequency response, but the real reason may just be the cost difference of the two capacitors.

When V1B turns off, its plate voltage rises sharply turning on V1A and rapidly charging Ct. When Ct reaches near full charge the rising cathode voltage turns V1A off and turns V1B back on, causing the plate voltage at V1B to drop. The pulse that occurs at the V1B plate while it is off is coupled to the CRT cathode through, C12 blanking the CRT during retrace.

With V1A off, Ct discharges through R22 and R23. After a partial discharge the voltage at the cathode of V1A drops to the point that it turns on, turning off V1B.

The voltage across Ct is directly connected to the input of the horizontal amplifier when the HOR./FREQUENCY SELECTOR switch is in any of the four sweep positions. When V1A is conducting the rapid charging of Ct draws the spot on the CRT to the left. during this time the CRT is blanked due to the pulse at the plate of V1B. This portion of the sweep is called RETRACE. When V1A turns off, Ct starts to discharge, lowering the voltage across

**Sweep Multivibrator:**

The sweep multivibrator circuit is shown in Figure 6. The frequency is determined by R22, in series with R23, the FREQUENCY VERNIER control, and a timing capacitor. The timing capacitor is switched with the HOR./FREQUENCY SELECTOR switch, and is one or more of C7, C8, C9 and C20 in series. In Figure 6 it is represented by a single capacitor Ct. R22, R23 and Ct form a parallel RC network.

---

**Figure 6**

Sweep Multivibrator Circuit

---

**Heathkit IO-21 Oscilloscope**

Sweep Multivibrator Circuit
Ct and at the input to the horizontal amplifier. This causes the dot to move right across the screen with blanking off. RC discharge is not linear, but the sweep only uses a few volts of the 180 volt charge, resulting in a reasonably linear sweep.

There are two positions of the HOR./FREQUENCY SELECTOR switch where the sweep multivibrator is not used. The first is the full CCW position where the horizontal amplifier gets its input from the horizontal input terminals on the front panel and the second is the next switch position where the horizontal amplifier gets its input from a 60 cycle sine wave developed from the 6.3 V filament winding.

**Power Supply:**
The power supply is conventional. there are two separate 6.3 V filament windings. This is

---

Figure 7: The Heathkit IO-21 out of its cabinet. Note the partial CRT shield on the tube’s neck. The three tubes in front are the horizontal amplifier 12AU7s and the 1V2 HV rectifier. The three tubes in the rear are the vertical amplifier 12AU7s and the 6X4 B+ rectifier. The tube closest to the scope front is the 12AX7 sweep multivibrator. The two black capacitors under the CRT neck are the HV filter capacitors. The four red wires going through the rubber grommets are the leads to the CRT deflection plates. They are kept away from the chassis and each other to reduce stray capacitance.
needed to isolate the high voltage on the filament of the CRT.

B+ is supplied by a full wave center tapped transformer winding and a 6X4 rectifier tube. Four voltages are developed: 375 volts for the vertical and horizontal CRT drivers, as well as the astigmatism grids of the CRT; two separate 200 volt outputs, one for each amplifier; and 185 volts for the sweep circuit.

High negative voltage is obtained from an additional transformer winding added to one of the B+ winding legs. It produces 850 volts and has a filament winding at the top for the 1V2 high-voltage rectifier. After the rectifier and filter, negative 820 volts is available for use by the CRT.

Heathkit IO-21 Assembly:
The IO-21 is one of the rare scopes of the period that does not use one or more printed circuit boards. All wiring is point-to-point. Construction with circuit boards make construction simpler, less error prone and more uniform between units. It is usually less expensive too. Why no circuit board was used in the IO-21 is unknown; the IO-10, sold alongside the IO-21, didn’t use a circuit board either. However, the older OL-1 and the IO-17, which was introduced during the run of the IO-21, both use a circuit board.

Construction begins after the builder inventories and becomes familiar with the parts. First, components are mounted on the bottom side of the chassis. These include the

Figure 8: Heathkit IO-21 chassis bottom. photo. Note large power transformer towards rear. IV2 HV rectifier socket is below the transformer, and 6X4 B+ rectifier is above. Large yellow and brown capacitors are the vertical and horizontal coupling capacitors respectively. Vertical amp is on top; horizontal is on bottom. B+ filter capacitor and sweep multivibrator are in the middle.
seven tube sockets, six three-lug terminal strips (The scope uses a total of nine terminal strips; all are three-lug type with the center lug grounded), five rubber grommets and a can capacitor mounting wafer to which the capacitor is then mounted. The chassis is then turned over and two more terminal strips are mounted to the chassis top.

Next, the front panel is attached to the chassis using three control potentiometers. The fuse holder, banana jacks, slide switch and remaining terminal strip are mounted to the rear of the chassis, and the CRT panel ring with bezel and graticule is mounted to the front panel.

Initial wiring is then begun along with the mounting of the rear CRT support bracket. The remaining front panel components are mounted including the HOR./FREQUENCY SELECTOR switch after its fixed capacitors are install on the switch terminals. The power transformer is then mounted and wired in.

Point-to-point wiring is done next, much of it from a table which shows 31 wire lengths to be cut and where to install them from and to. This is followed by component installation and wiring. Again a similar table is used for many of the resistors.

Final wiring includes adding the few components on the top of the chassis, installing the FOCUS and ASTIGMATISM internal controls to the CRT support bracket, installing the CRT including the CRT socket, and wiring up the socket and a few additional components. The line cord is added last.

Final assembly involves installing the fuse in its holder, adding the handle and feet to the cabinet, constructing a set of test leads and adding the stick on labels to the rear apron. The final steps before checkout is to mount the six front panel knobs and on later models the blue Heathkit series information label.

**Heathkit IO-21 Test and Adjustment:**
Once completed, the scope undergoes a short test and adjustment procedure. As expected with the later Heathkit manuals, the procedure and is given as steps and well thought out. Heath recommends you read through the two-plus pages of this section before you start. No test instruments are needed for the checkout, though it will be necessary to have a VTVM or similar meter if you encounter problems. There are three adjustments that...
need to be carried out: The first two involve adjusting the internal **FOCUS** and **ASTIGMATISM** controls for a small round dot; the third involves rotating the CRT to position the horizontal trace properly. This can be time-consuming as you need to power-down the scope and unplug it before you attempt to rotate the CRT, and it might take numerous iterations to get it aligned to the graticule line. Due to the dangerous high voltage around the CRT socket, don’t be tempted to do it with the power on.

Figures 7, 8 and 9 show the insides of the IO-21 oscilloscope and include some comments on the layout. The scope appears to be in the original assembly configuration and hasn’t been ‘restored’ with new capacitors and other components. The scope still works well, with a bright trace and no obvious flaws. This scope was probably later in the production run since it has the Heathkit ‘Blue Label’ showing the production series and serial number. The manual I purchased from the new Heathkit Company was dated 3/1/63 which was prior to the epoch when Heath began issuing the labels.

**The Heathkit Manual:**
If you own a Heathkit, even if you don’t plan to do any restoration on it, you should have a decent copy of the manual. While some manuals may be found on line, a lot of those are only partial manuals and don’t show construction, or are missing other important pages. It is amazing that a lot of people don’t think the parts list is worth copying, yet they copy the generic soldering instructions, which appear in almost every manual. Complete manuals are available from numerous sources including the “new” Heathkit Company and W7FG’s Vintage Manuals. Ebay is another manual source. A good philosophy is to have a paper manual for each Heathkit you own.

Be aware that kits and manuals can receive updates over the production of a kit. Manuals prior to the early seventies usually have a date, either on the back cover or the table-of-contents page. Sometime in the 70’s manual dating was stopped altogether and only the copyright year retained. Around the same time, Heath started putting a dash number after the manual part number which usually starts with a 595-N-V, where N is the multi-digit manual number and V is the manual version dash number. The manual date or dash number changing may or may not indicate a change in the kit and/or manual. Sometimes it is just a reprinting of a manuals without changes. Usually when a design change or manual correction is implemented, it is done with a change sheet included with the manual and the printed manual is not updated until the current manuals are exhausted.

**Comments:**
The IO-21 is a favorite kit of Chuck Penson - WA7ZZE author of three Heathkit books. It was the first Heathkit he assembled. He has collected a small batch of them, and is currently getting ready to do a major restoration of one of them. While he was driving through Orange County a few years back we met for lunch and he passed along the IO-21 that I used for this article.
This is *Heathkit of the Month* article #96. In a few more months the one-hundredth article will appear. After that I plan to slow down a bit and actually spend some time going over past articles and correcting and updating some of them.

The articles are written using Apple© Pages software. Originally it was a really good word-processing program which allowed alternating margins and lots of features that were taken advantage of in these articles. Then one day compatibility with the then new iPad became important and Pages got an ‘update’ that took away many of the features these articles incorporate. The pre-updated version continued to be used for awhile until it no longer worked after a system update. This made correcting and updating previous articles difficult to nearly impossible. Documents using alternating margins would not update correctly. Often graphics ended up behind text where they could not be extracted or moved. Word-wrap was also inconsistent between versions making a lot of reformatting necessary.

I have to say Apple has been slowly correcting the problems and restoring features. Now the program is once again viable and I will be able to update the early articles without difficulty - I believe! There is still a problem where graphics that were ‘dropped in’ during the creation of the original article won’t update. There is a work-around for this, though it means more time will still be needed for those cases.

I haven’t decided what kit to write about next. I have a simple one, an EUW-18 Laboratory Meter that I’ve been holding back for when a short article is needed. There is also an IM-4180 FM Deviation Meter sitting on the shelf, complete with manual.

**Notes:**

1. CRT - Cathode Ray Tube
2. The two-page ad may be found here: [http://www.w6ze.org/Heathkit/Kit_Ads/IO21_10_FW1961.jpg](http://www.w6ze.org/Heathkit/Kit_Ads/IO21_10_FW1961.jpg)
3. Heath did continue to offer specialized 3” CRT “Vectorscopes” for color TV servicing after 1971.
4. ASTIGMATISM controls the shape of the dot on the CRT. It interacts with the FOCUS control
5. A full schematic of the IO-21 is available at: [http://www.w6ze.org/Heathkit/Sch/IO-21-Sch.pdf](http://www.w6ze.org/Heathkit/Sch/IO-21-Sch.pdf)
6. The 2 µf 200V Mylar capacitor (27-21) cost $1.15. The 20 µf 150V electrolytic (25-19) cost only 55¢ and works well in the less critical horizontal amplifier.

Last month’s A-1 Audio Amplifier article was fun to write. A lot of effort went into researching the history. I was saddened that I didn’t get any feedback from someone who could provide some of the missing information. There has to be a few still in use or in storage out there.

73, from AF6C

*Remember, if you are getting rid of any old Heathkit Manuals or Catalogs, please pass them along to me for my research.*

Thanks - AF6C
The OCARC General meeting was held on Friday 2019-10-25 at Rodrigo’s restaurant in Tustin. The different venue was chosen for the October General Meeting because the Red Cross Building was still being remodeled.

In attendance were 24 members and visitors. All of the OCARC directors were present except Tim N6GP and Nicholas AF6CF to provide a Board quorum.

Program:

The speaker at the October Gen Meeting was Wayne Yoshida KH6WZ discussing:

“An RF Transistor Factory Tour”.

Wayne explained the basics of designing RF transistor amplifiers as “hybrids”….meaning using transistors with discrete capacitor chips, and tiny wire connections that acted like inductors, that could be tuned to the correct amplifier frequency range. Although the MaCom company is no longer in business…their RF amplifiers are “classic designs” and are still sought after in swap-meets and e-bay and copied by commercial companies.

Business:

Club Radio Auction schedule – Dan KI6X announced that the club’s yearly Radio Auction had to be rescheduled for January 17…due to difficulties finding a suitable venue. The January Radio Auction will be again held at the Red Cross facility in Santa Ana.

Membership Report – Corey KE6YHX reported that the OCARC membership had reached 99 members.

Elmer questions – Several discussions covered “how to tune” a classic Hustler vertical antenna. One main point was that a very narrow range of good SWR on 75M was all that could be expected. 75M will not be a wide-frequency band.

Cushcraft Vertical Antenna – Ken, W6HHC, announced that he has a Cushcraft 6-band R6000 vertical antenna for sale. The one-half-wavelength design of the R6000 antenna means that it does NOT require radials to work.

Submitted by: Ken, W6HHC OCARC Secretary
The OCARC Board meeting was held at the Marie Calendar’s Restaurant at 307 E Katella Ave. in Orange on Saturday morning, November 02, at 8 AM. Attendance was 9 members. All of the directors, except Vijay KM6IZO, were present for a Board quorum.

**Director Reports:**

- **Activities** – Ron W6WG reported that he secured the school site in Huntington Beach to be used for Winter Field Day in 2020. The dates are Jan 24-thru-26.
- **Publicity** – While Vijay was absent and did not provide a report, both Ken W6HHC and Nicholas AF6CF reported that HRO radio store was out of OCARC club brochures. Dan KI6X will advise Vijay to take more club brochures to HRO.
- **Membership** – Corey KE6YHX reported that past-member Sam Kelly W6JTT had become a silent key (SK)

**Old Business:**

- **Newspaper Editors**
  - Nov – Dan KI6X
  - Dec – Greg W6ATB
  - Jan – ???

- **General Meeting Programs**
  - **Nov 15** – Program will be on Bioenno Battery Technology and also OCARC 2020 Officer Elections. (The meeting location will be ????) [Editor’s note – location will be back at Red Cross Building.]
  - **Dec 06** – The OCARC Club Dinner will be held on Friday evening, Dec 6, at Mimi’s Café in Tustin. No OCARC General Meeting will be conducted in December.
  - **Jan 17** – The yearly OCARC radio auction has been delayed and rescheduled for January 17 at the Red Cross building.

- **By-Laws Update Committee**
  Tim N6GP pointed out a few areas of update that were not yet clear. Much discussion followed and resolutions were reached by the board members on each area. The plan is to hold a first reading for the club membership of the updated proposed Bylaws at the February 2020 club general meeting.

- **2020 Nomination Committee**
  The OCARC election of 2020 officers will be held at the November General Meeting. Tim N6TMT the Nomination Committee chair, reported that the following members had agreed to run for board offices for the election in November:
  - Pres .......... Dan KI6X
  - V Prez ....... Tim N6TMT
  - Treas......... Greg W6ATB
  - Secretary... Ken W6HHC
  - Activities.... ?open?
  - Members Corey KE6YHX
  - Publicity ?open?
  - Technical Bob AF6C
  - Dir-at-Lrg1 Ron W6WG
  - Dir-at-Lrg2 Tim N6GP
...Prizes for December Christmas Dinner
The board agreed to plan for buying 20 ea “radio prizes” for the approved $500 budget. The items will be of varying values.

New Business:
• Audit Committee – “el Prez” Dan Kl6X appointed the following members to audit the club’s 2019 financial records, beginning in January 2020:
  – Tim N6TMT
  – Bob AF6C
  – Ken W6HHC
  – Greg W6ATB (out-going treasurer).

• Appointment of HONORARY MEMBERS for 2020 – The board agreed to select the following people to be recognized as Honorary Members of OCARC during 2020:
  – Bob Evans WB6IXN
  – Chip Margelli K7JA
  – Janet Margelli KL7MF

• Club Badges – Bob AF6C (who makes the badges for OCARC members) reported that the US Post Office rejected an envelope containing a “badge clip” being shipped to a member as “being too thick” without significant additional postage. Bob suggested that the club no longer try to mail clips…but to make them available at OCARC meetings. The board agreed.

Upcoming Activities

NOVEMBER

- *ARRL Sweepstakes CW:* 2100 UTC Saturday Nov. 2 through 0259 UTC Monday Nov. 4.
- **10-10 Fall Contest, Digital:** 0001 UTC Friday Nov. 9 through 2359 UTC Monday Nov. 10.
- *ARRL Sweepstakes SSB:* 2100 UTC Saturday Nov. 16 through 0259 UTC Monday Nov. 18.
- *CQ World Wide DX / CW:* 0000 UTC Saturday Nov. 23 through 2400 UTC Monday Nov. 24.

DECEMBER

- *ARRL 160 Meter Contest:* 2200 UTC Friday Dec. 6 through 1600 UTC Sunday Dec. 8.
- *ARRL 10 Meter Contest:* 0000 UTC Saturday Dec. 14 through 2359 UTC Sunday Dec. 15.
- **RAC Canada Winter Contest:** 0000 UTC Saturday Dec. 29 through 2359 UTC Saturday Dec. 28.

Repeating Activities:

- **Phone Fray:** Every Tuesday night at 0230Z to 0300Z.
- **CWops Mini-CWT:** Every Wednesday at 1300 to 1400 UTC, 1900-2000 UTD and Thursday 0300-0400 UTC.
- **SKCC:** Weekend Sprintathon (Straight Key CW) on the first weekend of the month after the 6TH of the month. 1200 Sat. to 2359Z Sunday.
- **SKCC:** Sprint (Straight Key CW) 0000Z to 0200Z on the 4TH Tuesday night (USA) of the month.

Send an email to Ron W6WG, w6wg@w6ze.org to have your favorite activity or your recent RadioActivity listed in next month’s column.

MiniTiouner-Express
Digital Amateur Television DVB-S/S2 Receiver / Analyzer

Available at DATV-Express.com

- Operates with Windows PC using free MiniTioune software from Jean-Pierre F6DZP
- Smaller than a stack of 2 decks of cards (picture above is full size)
- Two independent simultaneous RF inputs with internal preamps
- High sensitivity -100dBm @1288MHz – at 1/2 FEC
- Fully assembled/tested in aluminum enclosure
- Covers 144-2420MHz (ideal for Space Station DATV reception)
- Symbol rates from 75 KSymb/s to >20 MSymbols/sec
- Uses external 8-24VDC supply or +5V from USB-3 port (with small modification)
- Real time signal modulation constellation & dBm signal strength display
- Price: US $75 + shipping – order with PayPal

For details & ordering go to www.DATV-Express.com
